SUMMARY

3+ years designing and delivering production-grade Java 17 / Spring Boot services for an enterprise SaaS platform serving global customers. Takes end-to-end ownership of backend modules — from architecture decisions and schema design to Elasticsearch tuning, API performance optimisation, and L3 incident resolution. Reduced search query latency by ~25% through targeted indexing and query restructuring. Looking to bring this depth of backend ownership and operational discipline to a senior engineering role where scale, reliability, and clean architecture matter.

CORE SKILLS

Languages & Frameworks: Java 8/17, Spring Framework, Spring Boot, Spring MVC, Microservices, REST APIs / RESTful Web Services, Hibernate / JPA

Backend & Data: Elasticsearch, SQL, PostgreSQL / MySQL, Schema design, Query optimisation & indexing, Pub/Sub, Event-driven architecture, Scheduled jobs

Build, DevOps & Tools: Git (GitHub, GitLab), Maven, Postman, GitHub, Cursor (AI-assisted development)

Production Support: L3 Production Support, Incident Triage, Root Cause Analysis (RCA), SLA management, Troubleshooting, Application performance monitoring

Practices: ITIL (Incident, Problem, Change Management), Agile / Scrum, Design patterns, Clean code principles, System design, Java Streams, Functional Interfaces, Performance optimisation, Debugging, JVM profiling / Memory analysis

Exposure: Angular, HTML5, Tailwind CSS

PROFESSIONAL EXPERIENCE

Software Engineer | Profit.co

🗓️ Jul 2022 – Present

- Reduced API response times by **~63% (800ms → 300ms)** through systematic profiling, query optimisation, and database indexing — improving platform responsiveness across 500–1000 enterprise organisations.
- Integrated and optimised Elasticsearch for advanced search and analytics, reducing query response time by ~25% through targeted indexing and query restructuring.
- Designed and implemented OKR check-in and alignment flows, multi-level approval workflows, and multi-timezone support for scheduling and reporting across globally distributed teams.
- Developed planned value generation, YTD / QTD calculation logic, and Bowler chart backend — aggregating historical and projected KPI data for executive-level performance reviews.
- Built email summary and share feature delivering scheduled OKR digests to 5,000+ users, and a real-time notifications system for OKR updates, approvals, and check-in reminders — both using Pub/Sub-based async dispatch.
- Built and maintained a daily Pub/Sub-triggered scheduled job to recalculate planned values and velocity metrics across all active organisations, ensuring KPI accuracy at scale.
- Developed MAT (Memory Analyser Tool) — an internal JVM heap profiler for identifying memory leaks in production, improving platform observability and enabling proactive stability management.
- Provided L3 production support across 500–1000 organisations — owning end-to-end incident triage, root cause analysis, and permanent fixes following ITIL processes for incident, problem, and change management.
- Collaborated with Product, QA, and Frontend (Angular / TypeScript) teams in Agile sprints; applied clean code principles, design patterns, and AI-assisted tooling (GitHub Copilot, Cursor) to maintain quality and velocity.

KEY ACHIEVEMENTS

- Built and delivered 10+ backend features end-to-end **including OKR check-ins, approval flows, Bowler chart, YTD/QTD, time zone support, Pub/Sub notifications,** and email digests to 5,000+ users — spanning full ownership from design to production.
- Developed MAT (Memory Analyser Tool) — an internal JVM heap profiler built on own initiative, enabling proactive memory leak detection and directly improving production stability.
- Eliminated recurring production incidents by implementing rigorous RCA and permanent fixes, reducing escalation rate and improving platform uptime across 500–1000 organisations.
- Accelerated development velocity using AI-assisted tooling (GitHub Copilot, Cursor), reducing code review cycles and improving overall code quality across backend modules.
